

Dr. Kashif Qazi
Database Project Phase 4
By: Rahul Ramjeawon, Adriana Causevic, Eliza Hajdarovic

Note* The table EM_CAST was removed from the database.

Introduction

(Explain the problem) Our project involves designing a database system for Netflix to manage various aspects of its operations including employees, departments, customers, games, movies, and TV shows.

(Setup) The database will store information such as employee details, department budget and roles, customer details, game information, and movie and TV show details including ratings, cast, and director information.

This database is to store and manage information related to the operations of Netflix, a company that provides streaming services for movies, TV shows, and games to its customers.

Entity Types and Relationships

Employee: This table in the database stores information about a person who works at Netflix such as their SSN, full name, phone number, email address, gender, home address, salary, position, clearance level, time at the company, and supervisor. Every employee belongs to a department and it is stored in the database as the ID of that department. An employee may also have a connection with a customer that they have helped, kind of like a recording feature that allows the company to keep track of which employee had a conversation with a customer for quality assurance.

Department: This table in the database stores information about a department name, Budget, Role, and every department has a unique ID. Every department has a manager and it is stored in the database as the manager's SSN. A department cannot exist without any employees. Each department manages different aspects of the company including movies and tv shows along with games. It is also possible for multiple departments to manage movies and tv shows.

Customer: This table in the database stores information about a customer who has created an account with Netflix such as their full name, subscription type, address, IP address, email, phone number, country, and password. Upon the creation of a new account, the system will generate a unique ID for that account which is also stored in the database. A valid email and password that the user has entered, which also exist in the database will be used as login information. Based on the customer's IP address they will be assigned a country.

Game: The Game table stores information about games that Netflix published. It stores the game id, name, size, studio, genre, and the department responsible for its development. Netflix partners with game development studios to create the games they publish and the games are

managed by a department. The customer is allowed to play these games and records which customer and how many times they have played the game.

Director: The director table stores information about directors including their name, age, and country. The directors from the table could have either directed a movie or tv show.

Movies: The Movie table stores information about movies including movie id, name, length, genre, size, if it's a Netflix original, and the department responsible for its production. Customers can watch and rate movies that they liked or didn't like. A movie also references the Director table to connect who was the director of what movie.

TV shows: The TV show table stores information about TV shows including show id, name, genre, size, episode count, if it's a Netflix original, and the department responsible for its production. Just like movies, customers can watch and rate tv shows. The Director of the tv show also references the director's table.

Front end (Using python)

Users can either log in or create a new user

The front end is a menu-based system where users can log in or if they do not have an account create one. Once an account has been created users can log in and access the home menu in which they will be asked to select a section they would like to view. This includes movies or tv shows and games. If the user selects a movie or tv show they would enter whichever respected section in which the user will be able to search for a Movie/tv show by name, filter by genre or they can select to show all movie or tv shows. Based on the previous selection a list of movies or tv shows will be displayed, from which the user can select, and information about the selected movie will be displayed, then they will be redirected to the home menu again where they can start all over again or log out. If the user selects the game option in the home menu, then a list of all games that Netflix currently has will be displayed.

The create new user function will ask the user to enter various personal information. But the function will also generate a random unique account number that does not exist in the database and assign it to the new customer. The system will also generate a random IP address for the user which will determine their country. For example, if the system generates the IP address “321” the user’s country will be “USA” all of which will be stored in the database.

There is an Admin feature. Once you are logged in as admin you can add and remove movies to the database. The function has the admin enter the movie or tv show details and sends an insert query to MySQL for it to be added to the respective table. To prevent errors

when adding new movies or tv shows, the system will generate a random unique ID that does not belong to any existing movie or tv show and assign it to the new one. The system will display all departments that exist, which the admin can select to avoid errors when selecting a department to place the movie or tv show. The system will also display all directors that exist, which the admin can also select as the director of the film to prevent errors when inserting into the database. Lastly, the remove function grants the admin the ability to easily remove any movie or tv show. The system will display all movies or tv shows along with their respective director, and the admin can just select the targeted movie or tv show to be removed permanently.
